iPhone Users Report Serious Warning Of Battery Drain After New Update

iPhone iOS 14.6 launched the Apple card family feature last week. After following the update the iPhone users are experiencing battery drain. It is worth noting that many factors contribute to device battery life, including device battery health but the same issue is forming in every device after a new update.

In the Apple support community and MacRumours, there are several members who are experiencing the same issue. They are stating that their device drains faster after completing the new update. Some of the users of Apple support forums note their experience with their Apple smart cover after the new update.

They wrote:-

I have the same issue with my iPhone 11. I upgraded the other day and I have woken up every morning to find it fully drained. Yesterday I turned off WiFi, Bluetooth, all background app refresh, and ensured that Personal Hotspot was off. It was fully charged at 6 pm last night and not used. It ran out of battery at around 10 am this morning (so, around 16 hours later) with no use in the meantime.

Another one said-

iPhone 11Pro did the same after the update. I have had an Apple Smart Cover on it since day 2 of being new. Never had to remove it. Today, after yesterday's update, it wiped out my phone to 2% and ran my cover down to 15%. Normally the phone stays at 100% and the cover might get as low as 20% after a 15 hour day with no plugging in. Battery health has maintained

100% for over a year. Must be part of the health recalibration. The Smart Cover battery icon is no longer on the lock or Home Screen when plugging or unplugging it.

Usually, this type of problem is caused after updating iOS. It is recommended to erase the phone then repeat fresh updates. Recently the company is testing iOS 14.7 but they will also release the update of 14.6.1 soon.
